What do the following situations have in common?

- A monkey jumps from the branch of one tree to the branch of an adjacent tree.
- A snowboarder glides at top speed off the end of a ramp (Figure 1).
- A relief package drops from a low-flying airplane.

In each situation, the body or object moves through the air without a propulsion system along a two-dimensional curved trajectory (Figure 2(a)). Such an object is called a projectile; the motion of a projectile is called projectile motion.

![Figure 1](image1.png)

How would you describe the motion of the snowboarder after leaving the ramp?

**Figure 2**

(a) A typical trajectory followed by a projectile.

(b) The change in velocity between position 1 and position 2 is \( \Delta \vec{v} = \vec{v}_2 - \vec{v}_1 \), which is shown as \( \frac{\Delta \vec{v}}{\Delta t} = -\vec{v}_1 \).

If \( \Delta \vec{v} \) is divided by the time \( \Delta t \) required for the motion from position 1 to position 2, the result is the average acceleration for that time interval.

It is evident that a projectile is accelerating because the direction of its instantaneous velocity is continually changing. However, in what direction is that acceleration occurring? Since \( \vec{a}_{av} = \frac{\Delta \vec{v}}{\Delta t} \), \( \vec{a}_{av} \) is in the direction of \( \Delta \vec{v} \). Figure 2(b) shows that the vector subtraction \( \Delta \vec{v} = \vec{v}_2 - \vec{v}_1 \) yields a vector directed downward, which indicates that the direction of acceleration is also downward.

In the Try This Activity at the beginning of Chapter 1, you considered two projectiles, balls A and B, which began moving simultaneously. Ball A fell from rest, while ball B was launched horizontally with an initial velocity. Although, as we show in Figure 3, B had a longer path than A, the two balls landed simultaneously. The initial horizontal motion of a projectile like ball B does not affect its vertical acceleration. Other experiments show the same thing. Figure 4 is a stroboscopic photograph of two balls released simultaneously. The ball on the right was projected horizontally. The interval between strobe flashes was constant. A grid has been superimposed on the photo to facilitate measurement and analysis. In successive equal time intervals, the vertical components of the displacement increase by the same amount for each ball. Note that the projected ball travels a constant horizontal displacement in each time interval. The independent horizontal and vertical motions combine to produce the trajectory.
If you look carefully at the grid superimposed on the photograph in Figure 4, you can make the following important conclusions about projectile motion:

- The horizontal component of a projectile’s velocity is constant. (The horizontal component of acceleration, in other words, is zero.)
- The projectile experiences constant downward acceleration due to gravity.
- The horizontal and vertical motions of a projectile are independent of each other, except they have a common time.

These conclusions are based on the assumption that air resistance can be neglected, an assumption we made when we analyzed the acceleration due to gravity in Section 1.3.

If you were performing an experiment to determine whether the concepts about projectile motion apply to an object on an inclined plane (for example, a puck moving on an air table set up at an angle to the horizontal), what observations would you expect to make? How would you analyze the motion of a projectile on an inclined plane to verify that the horizontal velocity is constant and the vertical acceleration is constant? You will explore these questions in Investigation 1.4.1 in the Lab Activities section at the end of this chapter.

**Analyzing the Motion of Objects Projected Horizontally**

**Projectile motion** is motion with a constant horizontal velocity combined with a constant vertical acceleration caused by gravity. Since the horizontal and vertical motions are independent of each other, we can apply independent sets of equations to analyze projectile motion. The constant velocity equations from Section 1.1 apply to the horizontal motion, while the constant acceleration equations from Sections 1.2 and 1.3 (with $|g| = 9.8 \text{ m/s}^2$) apply to the vertical motion.

*Figure 5* shows the initial and final velocity vectors for a projectile, with their horizontal and vertical components. Table 1 summarizes the kinematics equations for both components. None of the variables has an arrow over it since these variables represent components of vectors, not vectors themselves. For example, $v_x$ represents the $x$-component (which is not a vector) of the initial velocity and $v_y$ represents the $y$-component (also not a vector) of the velocity after some time interval $\Delta t$. The horizontal displacement, $\Delta x$, is called the **horizontal range** of the projectile.

**SAMPLE problem 1**

A ball is thrown off a balcony and has an initial velocity of 18 m/s horizontally.

(a) Determine the position of the ball at $t = 1.0 \text{ s}$, 2.0 s, 3.0 s, and 4.0 s.

(b) Show these positions on a scale diagram.

(c) What is the mathematical name of the resulting curve?

**Solution**

(a) Let the +x direction be to the right and the +y direction be downward (which is convenient since there is no upward motion) (see Figure 6(a)).

*Horizontally (constant $v_x$):*

$v_x = 18 \text{ m/s}$

$\Delta t = 1.0 \text{ s}$

$\Delta x = ?$

$\Delta x = v_x \Delta t$

$= (18 \text{ m/s})(1.0 \text{ s})$

$\Delta x = 18 \text{ m}$

Table 2 gives the $\Delta x$ values for $\Delta t = 1.0 \text{ s}, 2.0 \text{ s}, 3.0 \text{ s}, \text{ and } 4.0 \text{ s}$.

*Vertically (constant $a_y$):*

$v_y = 0$

$\Delta t = 1.0 \text{ s}$

$a_y = +g = 9.8 \text{ m/s}^2$

$\Delta y = ?$

$\Delta y = v_y \Delta t + \frac{1}{2} a_y (\Delta t)^2$

$= \frac{1}{2} a_y (\Delta t)^2$

$= \frac{[9.8 \text{ m/s}^2](1.0 \text{ s})^2}{2}$

$\Delta y = +4.9 \text{ m}$

Table 2 gives the $\Delta y$ values for $\Delta t = 1.0 \text{ s}, 2.0 \text{ s}, 3.0 \text{ s}, \text{ and } 4.0 \text{ s}$.

(b) Figure 6(b) shows a scale diagram of the ball's position at the required times. The positions are joined with a smooth curve.

(c) The curved path shown in Figure 6(b) is a parabola.

For Sample Problem 2
(a) The situation
(b) The initial conditions

Figure 7
For Sample Problem 2
(a) The situation
(b) The initial conditions

A child travels down a water slide, leaving it with a velocity of 4.2 m/s horizontally, as in Figure 7(a). The child then experiences projectile motion, landing in a swimming pool 3.2 m below the slide.
(a) For how long is the child airborne?
(b) Determine the child’s horizontal displacement while in the air.
(c) Determine the child’s velocity upon entering the water.

Solution
As shown in Figure 7(b), +x is to the right and +y is downward. The initial position is the position where the child leaves the slide.

(a) Horizontally (constant $v_i_x$):
\[ v_{ix} = 4.2 \text{ m/s} \]
\[ \Delta x = \ ? \]
\[ \Delta t = \ ? \]

Vertically (constant $a_y$):
\[ v_{iy} = 0 \]
\[ \Delta y = 3.2 \text{ m} \]
\[ a_y = +g = 9.8 \text{ m/s}^2 \]
\[ v_{fy} = \ ? \]
\[ \Delta t = \ ? \]

The horizontal motion has two unknowns and only one equation $\Delta x = v_{ix} \Delta t$. We can analyze the vertical motion to determine $\Delta t$:
\[ \Delta y = v_{iy} \Delta t + \frac{1}{2} a_y (\Delta t)^2 \]
\[ \Delta y = \frac{1}{2} a_y (\Delta t)^2 \]
\[ (\Delta t)^2 = \frac{2\Delta y}{a_y} \]
\[ \Delta t = \pm \sqrt{\frac{2\Delta y}{a_y}} \]
\[ = \pm \sqrt{\frac{2(3.2 \text{ m})}{9.8 \text{ m/s}^2}} \]
\[ \Delta t = \pm 0.81 \text{ s} \]

Since we are analyzing a trajectory that starts at $t = 0$, only the positive root applies. The child is in the air for 0.81 s.

(b) We can substitute $\Delta t = 0.81 \text{ s}$ into the equation for horizontal motion.
\[ \Delta x = v_{ix} \Delta t \]
\[ = (4.2 \text{ m/s})(0.81 \text{ s}) \]
\[ \Delta x = 3.4 \text{ m} \]

The child reaches the water 3.4 m horizontally from the end of the slide. In other words, the child’s horizontal displacement is 3.4 m.

(c) To find the child’s final velocity, a vector quantity, we must first determine its horizontal and vertical components. The x-component is constant at 4.2 m/s. We find the y-component as follows:
\[ v_{fy} = v_{iy} + a_y \Delta t \]
\[ = 0 \text{ m/s} + (9.8 \text{ m/s}^2)(0.81 \text{ s}) \]
\[ v_{fy} = 7.9 \text{ m/s} \]
We now apply the law of Pythagoras and trigonometry to determine the final velocity as shown in Figure 8.

\[ v_f = \sqrt{v_{fx}^2 + v_{fy}^2} \]
\[ v_f = \sqrt{(4.2 \text{ m/s})^2 + (7.9 \text{ m/s})^2} \]
\[ v_f = 8.9 \text{ m/s} \]

\[ \theta = \tan^{-1} \left( \frac{v_{fy}}{v_{fx}} \right) \]
\[ \theta = \tan^{-1} \left( \frac{7.9 \text{ m/s}}{4.2 \text{ m/s}} \right) \]
\[ \theta = 62^\circ \]

The final velocity is 8.9 m/s at an angle of 62° below the horizontal.

**SAMPLE problem 3**

A helicopter, travelling horizontally, is 82 m above the ground. The pilot prepares to release a relief package intended to land on the ground 96 m horizontally ahead. Air resistance is negligible. The pilot does not throw the package, but lets it drop. What is the initial velocity of the package relative to the ground?

**Solution**

Figure 9 shows the situation, with the initial position chosen as the point of release, +x chosen to the right, and +y chosen downward. Since the pilot does not throw the package, the initial horizontal velocity of the package is the same as the horizontal velocity of the helicopter.

Horizontally (constant \( v_{ix} \)):

\[ \Delta x = 96 \text{ m} \]
\[ \Delta t = ? \]
\[ v_{ix} = ? \]

Vertically (constant \( a_y \)):

\[ v_{iy} = 0 \text{ m/s} \]
\[ a_y = +g = 9.8 \text{ m/s}^2 \]
\[ \Delta y = 82 \text{ m} \]
\[ \Delta t = ? \]

As in Sample Problem 2, we can determine \( \Delta t \) from the equations for vertical motion. The appropriate equation is

\[ \Delta y = v_{iy} \Delta t + \frac{1}{2} a_y (\Delta t)^2 \]

\[ \Delta y = \frac{1}{2} a_y (\Delta t)^2 \]

\[ (\Delta t)^2 = \frac{2\Delta y}{a_y} \]

\[ \Delta t = \pm \sqrt{\frac{2\Delta y}{a_y}} \]

\[ \Delta t = \pm \sqrt{\frac{2(82 \text{ m})}{9.8 \text{ m/s}^2}} \]

\[ \Delta t = 4.1 \text{ s} \]
Analyzing More Complex Projectile Motion

In the projectile problems we have solved so far, the initial velocity was horizontal. The same kinematics equations can be used to analyze problems where the initial velocity is at some angle to the horizontal. Since \( \nu_y \neq 0 \), you must take care with your choice of positive and negative directions for the vertical motion. For example, a fly ball in baseball...

Since we only consider events after the release of the package at \( t = 0 \), only the positive root applies.

\[
\nu_x = \frac{\Delta x}{\Delta t} = \frac{96 \text{ m}}{4.1 \text{ s}} = 23 \text{ m/s}
\]

The initial velocity of the package is 23 m/s [horizontally].

Answers

3. (a) 0.395 s  
   (b) 76.3 cm  
   (c) 4.33 m/s [63.5° below the horizontal]  
4. (a) At 3.0 s, \( \Delta x = 24 \text{ m} \),  
       \( \Delta y = 44 \text{ m} \), and  
       \( \bar{v} = 3.0 \times 10^1 \text{ m/s} \)  
       [75° below the horizontal].  
   (d) 9.8 m/s² [down]  
5. 45 m/s

Figure 10

When the steel ball is launched from the ramp and collides with the target plate, the point of contact is recorded on the target paper.

Practice

Understanding Concepts

1. Explain why an airplane moving through the air is not an example of projectile motion.
2. A stone is thrown horizontally under negligible air resistance. What are its vertical acceleration and its horizontal acceleration?
3. A marble rolls off a table with a velocity of 1.93 m/s [horizontally]. The tabletop is 76.5 cm above the floor. If air resistance is negligible, determine  
   (a) how long the marble is airborne  
   (b) the horizontal range  
   (c) the velocity at impact
4. A stone is thrown horizontally with an initial speed of 8.0 m/s from a cliff. Air resistance is negligible.  
   (a) Determine the horizontal and vertical components of displacement and instantaneous velocity at \( t = 0.0 \text{ s}, 1.0 \text{ s}, 2.0 \text{ s}, \text{ and } 3.0 \text{ s} \).
   (b) Draw a scale diagram showing the path of the stone.
   (c) Draw the instantaneous velocity vector at each point on your diagram.
   (d) Determine the average acceleration between 1.0 s and 2.0 s, and between 2.0 s and 3.0 s. What do you conclude?
5. A baseball pitcher throws a ball horizontally under negligible air resistance. The ball falls 83 cm in travelling 18.4 m to the home plate. Determine the ball’s initial horizontal speed.

Applying Inquiry Skills

6. Figure 10 shows a trajectory apparatus. A vertical target plate allows the horizontal position to be adjusted from one side of the graph paper to the other.  
   (a) Describe how this apparatus is used to analyze projectile motion.
   (b) What would you expect to see plotted on graph paper? Draw a diagram.  
      If you have access to a trajectory apparatus, use it to check your prediction.

Making Connections

7. When characters in cartoons run off the edge of a cliff, they hang suspended in the air for a short time before plummeting. If cartoons obeyed the laws of physics, what would they show instead?
(Figure 11) has an initial velocity with an upward vertical component. If the $+y$ direction is chosen to be upward, then $v_y$ is positive, and the vertical acceleration $a_y$ is negative because the gravitational acceleration is downward. Conversely, if the $+y$ direction is chosen to be downward, then $v_y$ is negative and $a_y$ is positive.

(a) $\Delta y > 0$

(b) $\Delta y < 0$

Figure 11
(a) The $+y$ direction is upward.
(b) The $+y$ direction is downward.

SAMPLE problem 4

A golfer strikes a golf ball on level ground. The ball leaves the ground with an initial velocity of 42 m/s [32° above the horizontal]. The initial conditions are shown in Figure 12. If air resistance is negligible, determine the ball's
(a) horizontal range (assuming that it lands at the same level from which it started)
(b) maximum height
(c) horizontal displacement when it is 15 m above the ground

Solution

(a) We begin by finding the horizontal and vertical components of the initial velocity.

$$ v_{ix} = \frac{|v_i| \cos \theta}{v_{iy} = \frac{|v_i| \sin \theta}{v_{ix} = 36 \text{ m/s}}$$

$$v_{iy} = 22 \text{ m/s}$$

Horizontally (constant $v_{ix}$):

$$v_{ix} = 36 \text{ m/s}$$

$\Delta x = \ ?$

$\Delta t = \ ?$

Vertically (constant $a_y$):

$$a_y = -g = -9.8 \text{ m/s}^2$$

$$\Delta y = 0$$

$$v_{iy} = 22 \text{ m/s}$$

$\Delta t = \ ?$

$$v_{iy} = -22 \text{ m/s}$$

Since the horizontal motion has two unknowns and only one equation, we can use the vertical motion to solve for $\Delta t$: 

$$\Delta y = v_y \Delta t + \frac{1}{2} a_y (\Delta t)^2$$

$$0 = 22 \text{ m/s} \Delta t - 4.9 \text{ m/s}^2 (\Delta t)^2$$

$$0 = \Delta t (22 \text{ m/s} - 4.9 \text{ m/s}^2 \Delta t)$$

Figure 12
Initial conditions for Sample Problem 4. The golf tee is chosen as the initial position, and the $+y$ direction is chosen as upward.
Applying Symmetry

The final vertical component of the velocity \((-22 \text{ m/s})\) has the same magnitude as the initial vertical component, since air resistance is negligible and the ground is level. Recall that the same symmetry occurs for an object thrown directly upward.

Therefore, the ball was hit at \(\Delta t = 0\) and the ball lands at \(22 \text{ m/s} - 4.9 \text{ m/s}^2 \Delta t = 0\). Solving for \(\Delta t\), we find that \(\Delta t = 4.5 \text{ s}\), which we can use to find the horizontal range.

\[
\Delta x = v_x \Delta t = (36 \text{ m/s})(4.5 \text{ s})
\]
\[
\Delta x = 1.6 \times 10^2 \text{ m}
\]

The horizontal range is \(1.6 \times 10^2 \text{ m}\).

(b) To determine the maximum height, we start by noting that at the highest position, \(v_y = 0 \text{ m/s}\). (This also happens when an object thrown directly upward reaches the top of its flight.)

\[
v_y^2 = v_y^2 + 2a_y \Delta y
\]
\[
0 = v_y^2 + 2a_y \Delta y
\]
\[
\Delta y = \frac{v_y^2}{-2a_y}
\]
\[
= \frac{(22 \text{ m/s})^2}{-2(-9.8 \text{ m/s}^2)}
\]
\[
\Delta y = 25 \text{ m}
\]

The maximum height is 25 m.

(c) To find the horizontal displacement when \(\Delta y = 15 \text{ m}\), we must find the time interval \(\Delta t\) between the start of the motion and when \(\Delta y = 15 \text{ m}\). We can apply the quadratic formula:

\[
\Delta y = v_y \Delta t + \frac{1}{2} a_y (\Delta t)^2
\]
\[
15 \text{ m} = 22 \text{ m/s} \Delta t - 4.9 \text{ m/s}^2 (\Delta t)^2
\]

Using the quadratic formula,

\[
\Delta t = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}
\]

where \(a = 4.9 \text{ m/s}^2\), \(b = -22 \text{ m/s}\), and \(c = 15 \text{ m}\)

\[
\Delta t = 3.7 \text{ s} \text{ or } 0.84 \text{ s}
\]

Thus, the ball is 15 m above the ground twice: when rising and when descending. We can determine the corresponding horizontal positions:

\[
\Delta x_{\text{up}} = v_x \Delta t = (36 \text{ m/s})(0.84 \text{ s}) = 30 \times 10^1 \text{ m}
\]
\[
\Delta x_{\text{down}} = v_x \Delta t = (36 \text{ m/s})(3.7 \text{ s}) = 13 \times 10^2 \text{ m}
\]

The horizontal position of the ball is either \(3.0 \times 10^1 \text{ m}\) or \(1.3 \times 10^2 \text{ m}\) when it is 15 m above ground.
As you learned in the solution to Sample Problem 4, the range of a projectile can be found by applying the kinematics equations step by step. We can also derive a general equation for the horizontal range $\Delta x$ of a projectile, given the initial velocity and the angle of launch. What, for example, happens when a projectile lands at the same level from which it began ($\Delta y = 0$), as shown in Figure 13? For the horizontal range, the motion is found using the equation $\Delta x = v_{ix} \Delta t$, where the only known variable is $v_{ix}$. To find the other variable, $\Delta t$, we use the vertical motion:

$$\Delta y = v_{iy} \Delta t + \frac{1}{2} a_y (\Delta t)^2$$

where $\Delta y = 0$ because we are considering the situation where the final level is the same as the initial level.

$$v_{iy} = v_i \sin \theta$$
$$a_y = -g$$

$$0 = v_i \sin \theta \Delta t - \frac{1}{2} g(\Delta t)^2$$

Therefore, either $\Delta t = 0$ (on takeoff) or $v_i \sin \theta = \frac{1}{2} g \Delta t = 0$ (on landing).

Solving the latter equation for $\Delta t$ gives

$$\Delta t = \frac{2v_i \sin \theta}{g}$$

Now we return to the horizontal motion:

$$\Delta x = v_{ix} \Delta t$$
$$= (v_i \cos \theta) \Delta t$$
$$= v_i \cos \theta \left( \frac{2v_i \sin \theta}{g} \right)$$

$$\Delta x = \frac{v_i^2}{g} 2\sin \theta \cos \theta$$

Since $2\sin \theta \cos \theta = \sin 2\theta$ (as shown in the trigonometric identities in Appendix A), the horizontal range is

$$\Delta x = \frac{v_i^2}{g} \sin 2\theta$$

where $v_i$ is the magnitude of the initial velocity of a projectile launched at an angle $\theta$ to the horizontal. Note that this equation applies only if $\Delta y = 0$.

All of the previous discussion and examples of projectile motion have assumed that air resistance is negligible. This is close to the true situation in cases involving relatively dense objects moving at low speeds, such as a shot used in shot put competition. However, for many situations, air resistance cannot be ignored. When air resistance is considered, the analysis of projectile motion becomes more complex and is beyond the intention of this text. The concept of “hang time” in certain sports, especially football, is important and is explored in Lab Exercise 1.4.1 in the Lab Activities Section at the end of this chapter.
A field hockey ball is struck and undergoes projectile motion. Air resistance is negligible.

(a) What is the vertical component of velocity at the top of the flight?
(b) What is the acceleration at the top of the flight?
(c) How does the rise time compare to the fall time if the ball lands at the same level from which it was struck?

A cannon is set at an angle of $45^\circ$ above the horizontal. A cannonball leaves the muzzle with a speed of $2.2 \times 10^2$ m/s. Air resistance is negligible. Determine the cannonball's
(a) maximum height
(b) time of flight
(c) horizontal range (to the same vertical level)
(d) velocity at impact

A medieval prince trapped in a castle wraps a message around a rock and throws it from the top of the castle wall with an initial velocity of $12$ m/s $[42^\circ$ above the horizontal]. The rock lands just on the far side of the castle’s moat, at a level $9.5$ m below the initial level (Figure 14). Determine the rock’s
(a) time of flight
(b) width of the moat
(c) velocity at impact

A projectile is an object moving through the air in a curved trajectory with no propulsion system.

Projectile motion is motion with a constant horizontal velocity combined with a constant vertical acceleration.

The horizontal and vertical motions of a projectile are independent of each other except they have a common time.

Projectile motion problems can be solved by applying the constant velocity equation for the horizontal component of the motion and the constant acceleration equations for the vertical component of the motion.

A projectile launched horizontally moves $16$ m in the horizontal plane while falling $1.5$ m in the vertical plane. Determine the projectile’s initial velocity.

A tennis player serves a ball horizontally, giving it a speed of $24$ m/s from a height of $2.5$ m. The player is $12$ m from the net. The top of the net is $0.90$ m above the court surface. The ball clears the net and lands on the other side. Air resistance is negligible.
(a) For how long is the ball airborne?
(b) What is the horizontal displacement?
(c) What is the velocity at impact?
(d) By what distance does the ball clear the net?

5. A child throws a ball onto the roof of a house, then catches it with a baseball glove 1.0 m above the ground, as in Figure 15. The ball leaves the roof with a speed of 3.2 m/s.
(a) For how long is the ball airborne after leaving the roof?
(b) What is the horizontal distance from the glove to the edge of the roof?
(c) What is the velocity of the ball just before it lands in the glove?

6. For a projectile that lands at the same level from which it starts, state another launch angle above the horizontal that would result in the same range as a projectile launched at an angle of 36°, 16°, and 45.6°. Air resistance is negligible.

7. During World War I, the German army bombarded Paris with a huge gun referred to, by the Allied Forces, as “Big Bertha.” Assume that Big Bertha fired shells with an initial velocity of 1.1 × 10³ m/s [45° above the horizontal].
(a) How long was each shell airborne, if the launch point was at the same level as the landing point?
(b) Determine the maximum horizontal range of each shell.
(c) Determine the maximum height of each shell.

8. An astronaut on the Moon, where \( |g| = 1.6 \text{ m/s}^2 \), strikes a golf ball giving the ball a velocity of 32 m/s [35° above the Moon’s horizontal]. The ball lands in a crater floor that is 15 m below the level where it was struck. Determine
(a) the maximum height of the ball
(b) the time of flight of the ball
(c) the horizontal range of the ball

Applying Inquiry Skills

9. A garden hose is held with its nozzle horizontally above the ground (Figure 16). The flowing water follows projectile motion. Given a metre stick and a calculator, describe how you would determine the speed of the water coming out of the nozzle.

Figure 16
Projectile motion in the garden

10. Describe how you would build and test a device made of simple, inexpensive materials to demonstrate that two coins launched simultaneously from the same level, one launched horizontally and the other dropped vertically, land at the same instant.

Making Connections

11. In real-life situations, projectile motion is often more complex than what has been presented in this section. For example, to determine the horizontal range of a shot in shot put competitions, the following equation is used:

\[
\Delta x = \Delta x_1 + \Delta x_2 + \Delta x_3
\]

\[
\Delta x = 0.30 \text{ m} + \frac{2v_i^2 \sin \theta \cos \theta}{g} + \frac{v_i \sin \theta \sqrt{v_i^2 \sin^2 \theta + 2g\Delta y}}{g}
\]

where 0.30 m is the average distance the athlete’s hand goes beyond the starting line, \( v_i \) is the magnitude of the initial velocity, \( \theta \) is the angle of launch above the horizontal, \( \Delta y \) is the height above the ground where the shot leaves the hand, and \( g \) is the magnitude of the acceleration due to gravity (Figure 17).

(a) Determine the range of a shot released 2.2 m above the ground with an initial velocity of 13 m/s [42° above the horizontal].
(b) Compare your answer in (a) to the world record for the shot put (currently about 23.1 m).
(c) Why do you think the equation given here differs from the equation for horizontal range derived in this section?
